Internship: Nasscom SmartBridge - Salesforce Administrator with AI Agentforce

Ganpat University

Team Lead : Itisha Desai Er. No. : 22162171006

Team Member : Nitish Marker Er. No. : 23162582009

Project Name: AI-Powered Customer Support & Service Automation

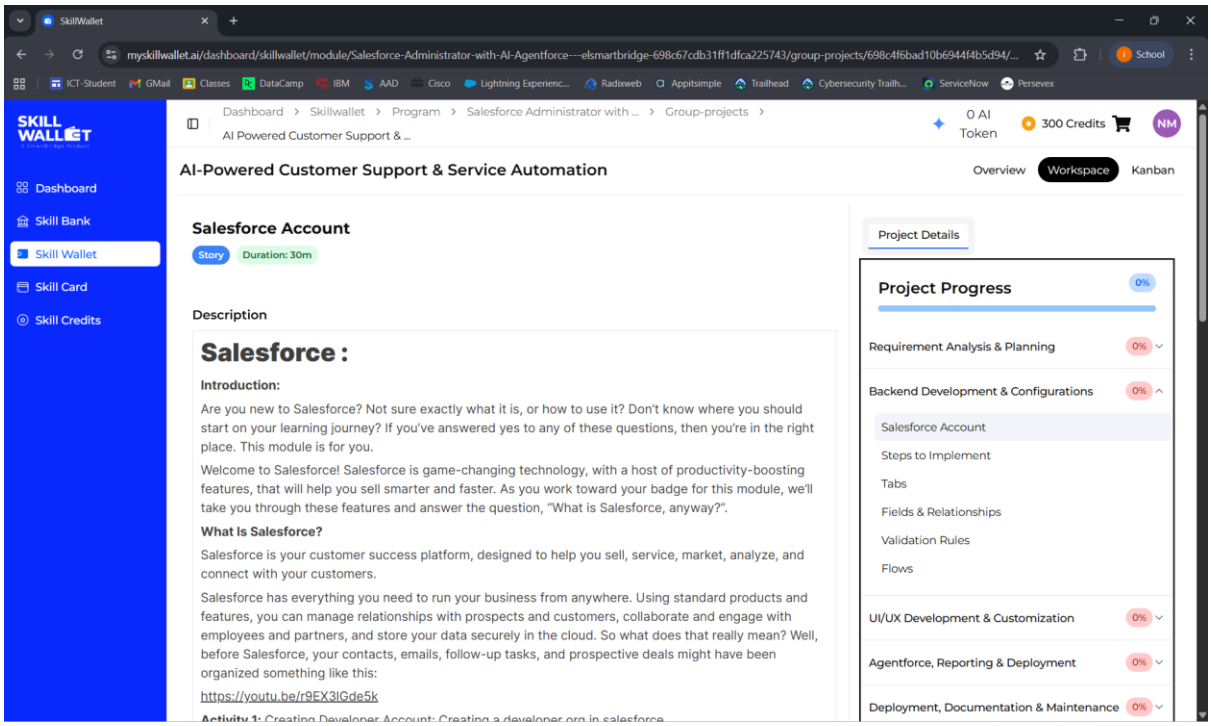
Platform: Salesforce & Skillwallet

Phase 2 : Backend Development & Configurations

1: Project Environment Setup

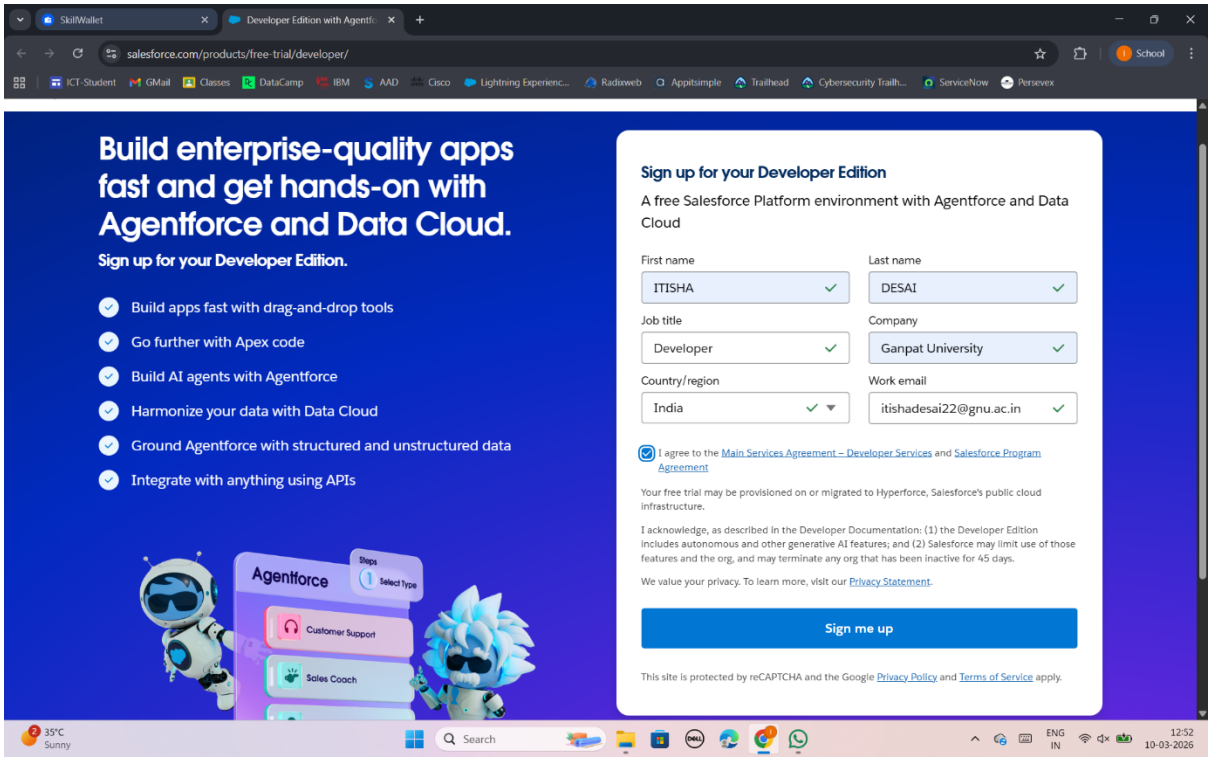
SkillWallet Workspace Overview :

This image captures the initial state of the "AI-Powered Customer Support & Service Automation" workspace. It serves as the project’s command center in Skillwallet platform.



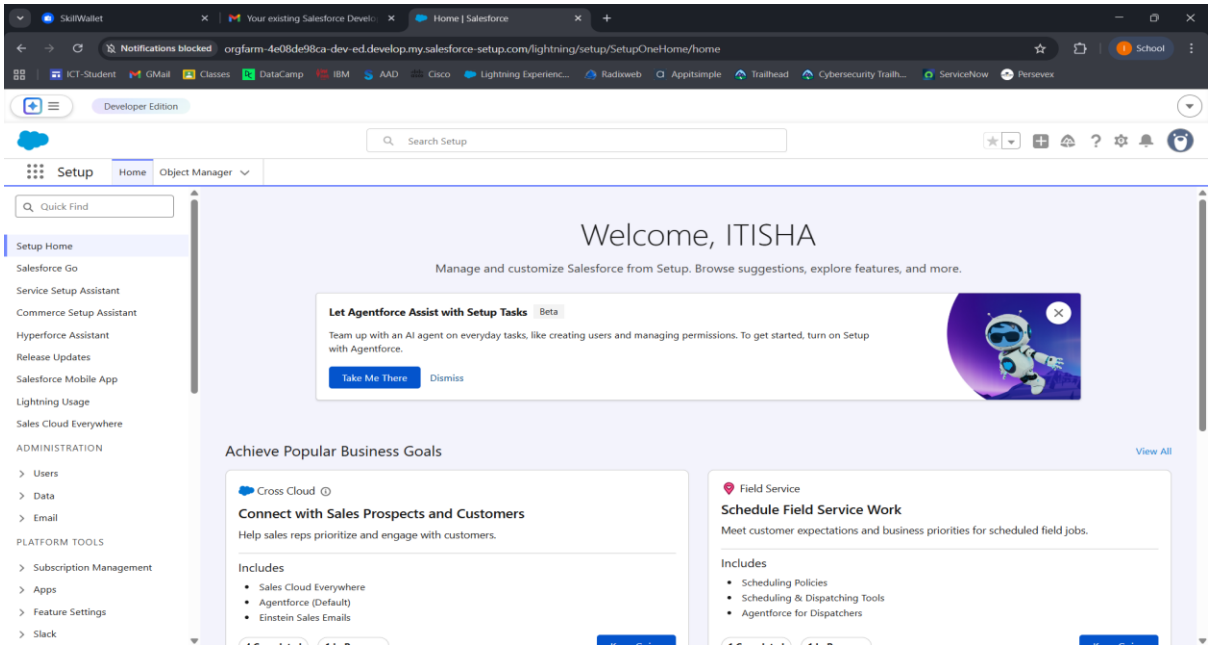
Salesforce Developer Edition Sign-up :

This confirms the registration of a specialized Salesforce Developer Edition org. This environment is critical as it is pre-configured with Agentforce and Data Cloud, which are required to implement the AI-based features described in the functional scope.



Salesforce Setup Home :

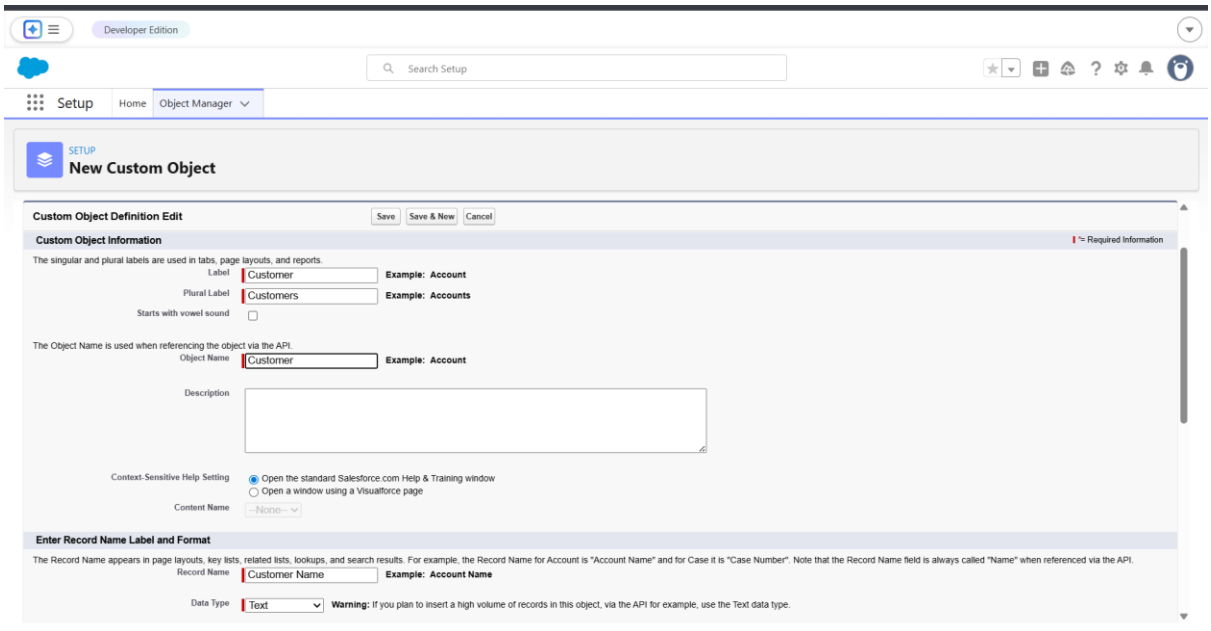
This screenshot shows the administrative landing page of the newly created Salesforce org. It is the starting point for all backend configurations, where I accessed the Object Manager to build the custom data schema.

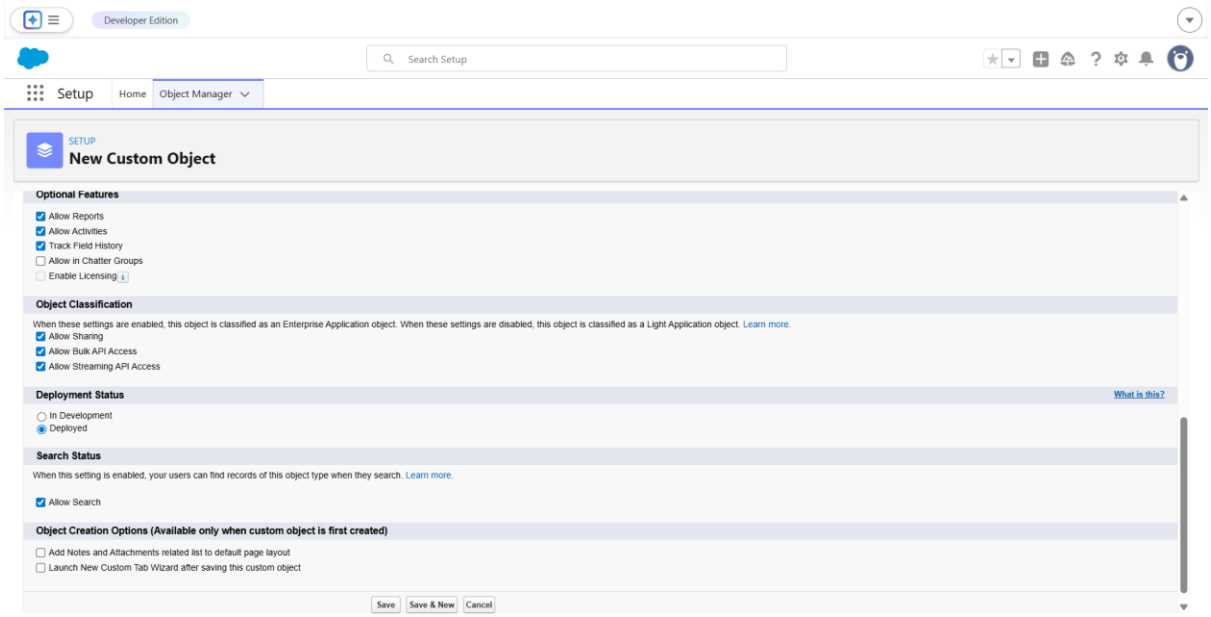


2: Custom Object Schema Construction

Creating the Customer Object :

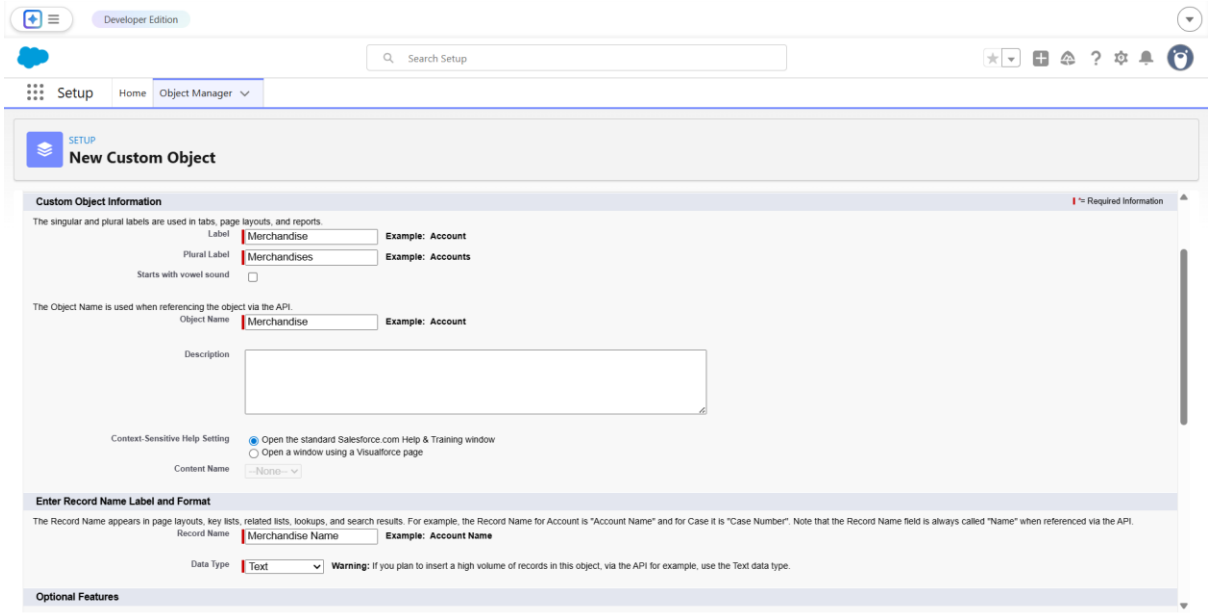
I initiated the creation of the Customer__c custom object to store unique client profiles. I enabled optional features like Reports and Field History Tracking and set the deployment status to Deployed to make the object active in the system.





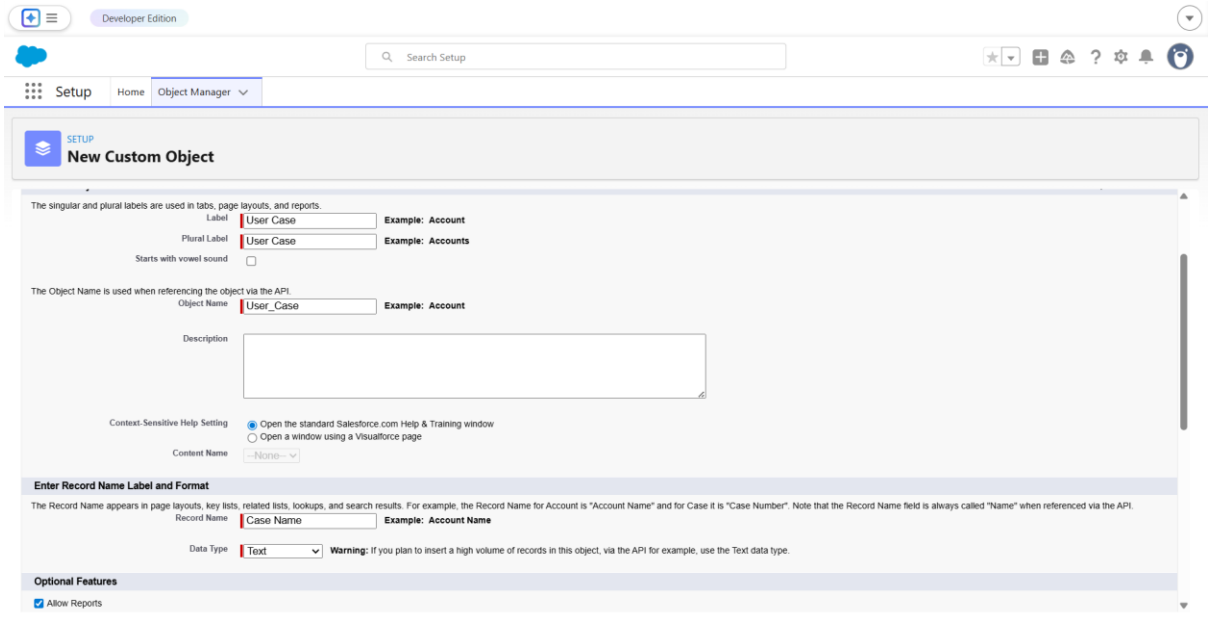
Creating the Merchandise Object :

This image shows the setup of the Merchandise__c object. This object is designed to hold information about products or items that will be the subject of customer inspections and support cases.



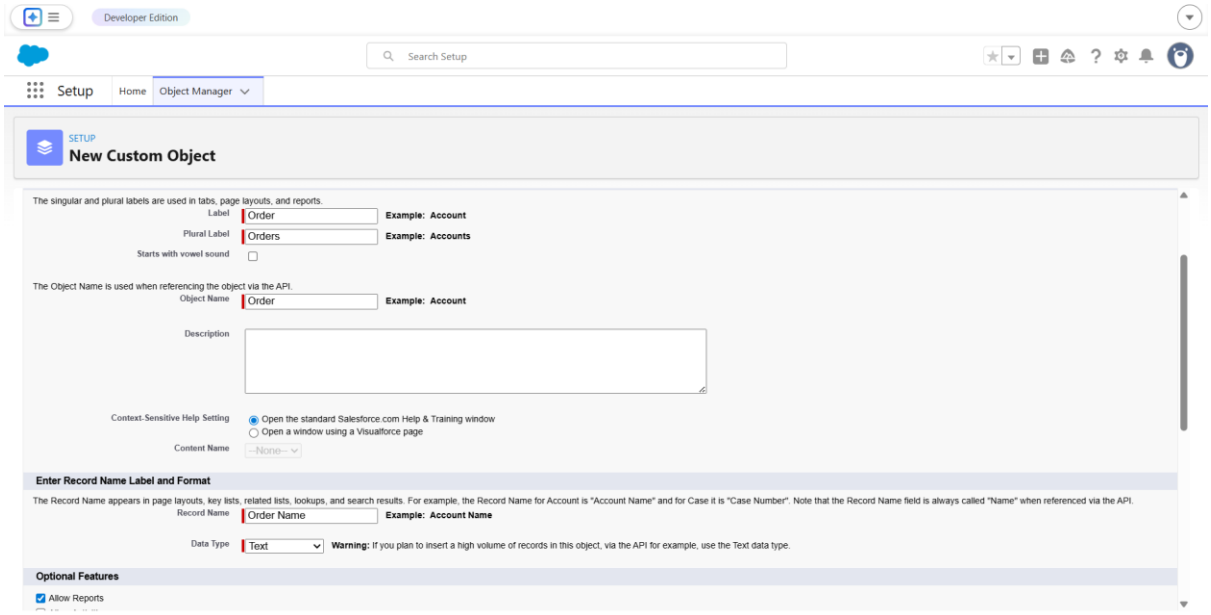
Creating the User Case Object :

I defined the User_Case__c object, which acts as the core record for tracking customer interactions. It is designed to capture the essential details that the AI will analyze to generate summaries.



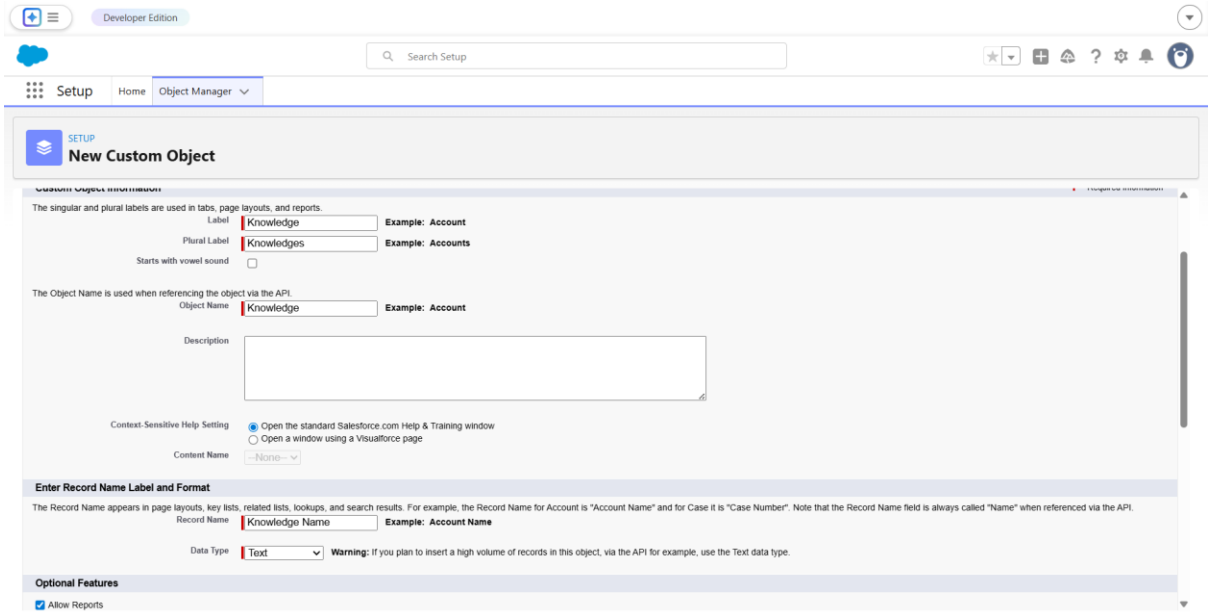
Creating the Order Object :

This screenshot documents the creation of the Order__c object. This allows the system to link specific support cases to transaction history, providing agents with full customer context.



Creating the Knowledge Object :

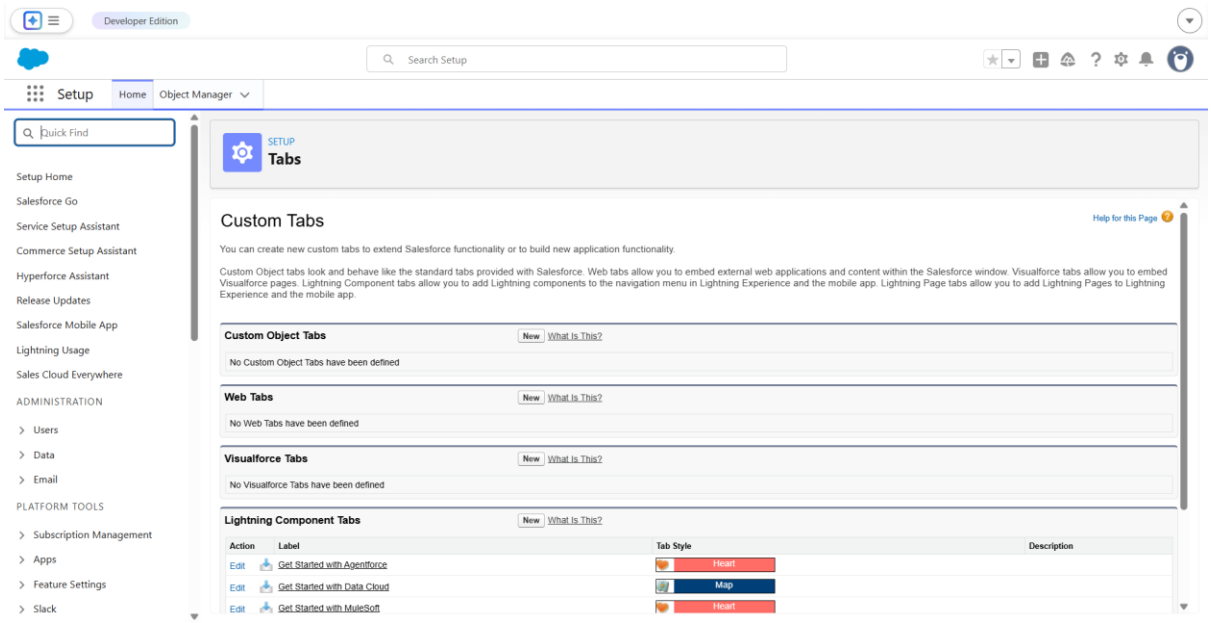
I established the Knowledge__c object to serve as a repository for support articles. This provides the "grounding" data necessary for AI to provide accurate, guided customer support responses.



3: Navigation and UI (Custom Tabs)

Tabs Configuration Page :

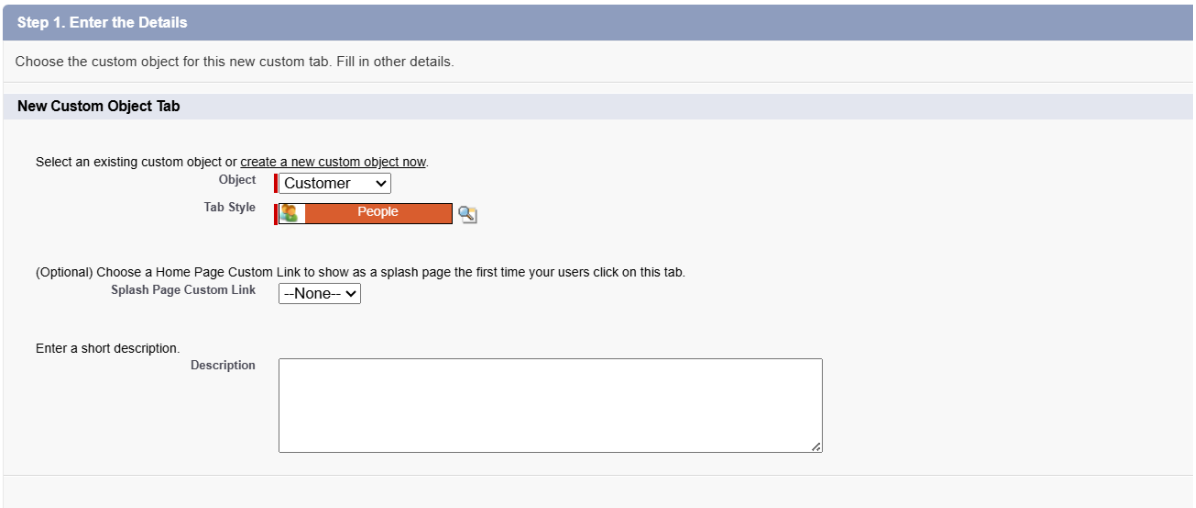
This view shows the Custom Tabs setup area in Salesforce. It is used to create web-accessible entry points so that the custom objects appear in the application's navigation bar.



Customer Tab Style :

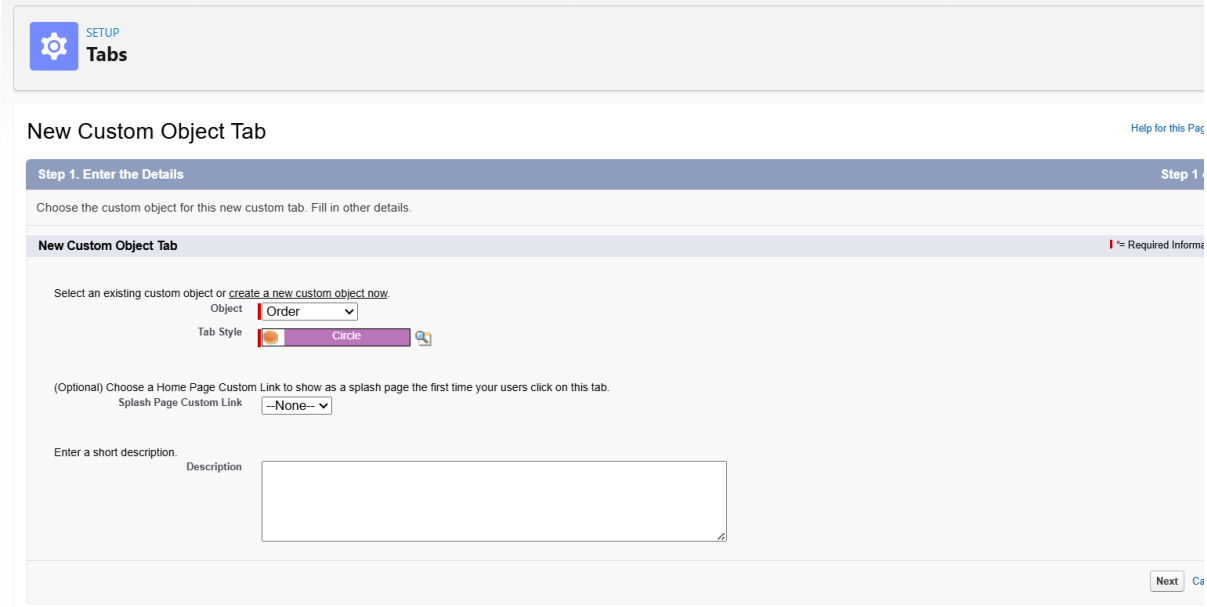
I assigned the "People" icon style to the Customer tab for clear visual identification within the Service Console.

New Custom Object Tab



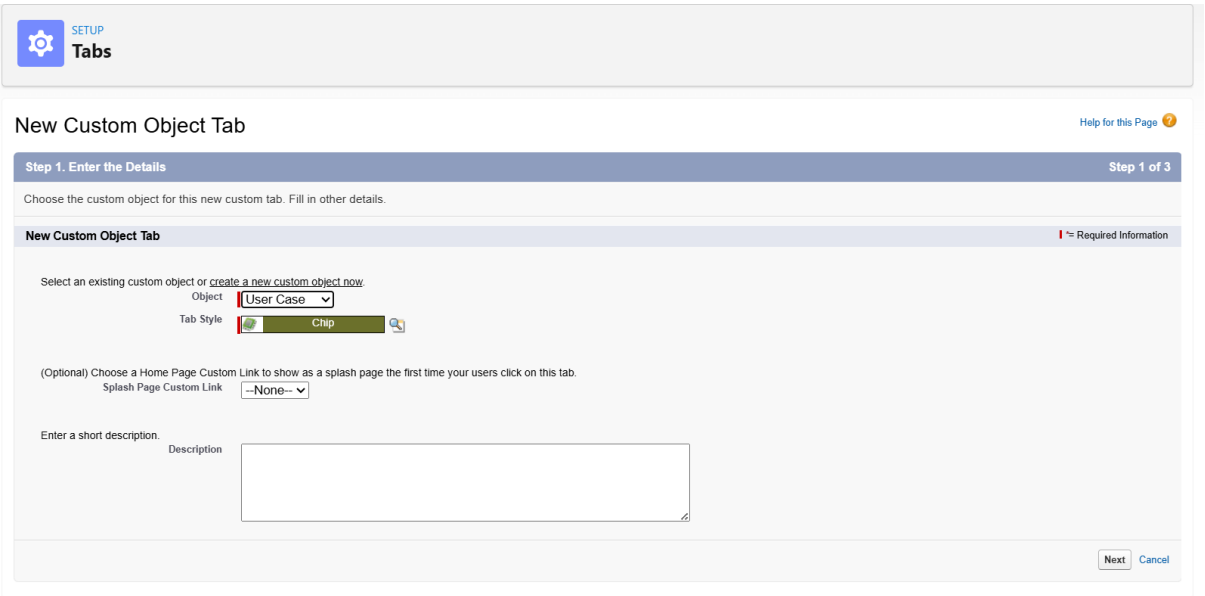
Order Tab Style :

The "Circle" icon style was assigned to the Order object to distinguish transactional records in the UI.



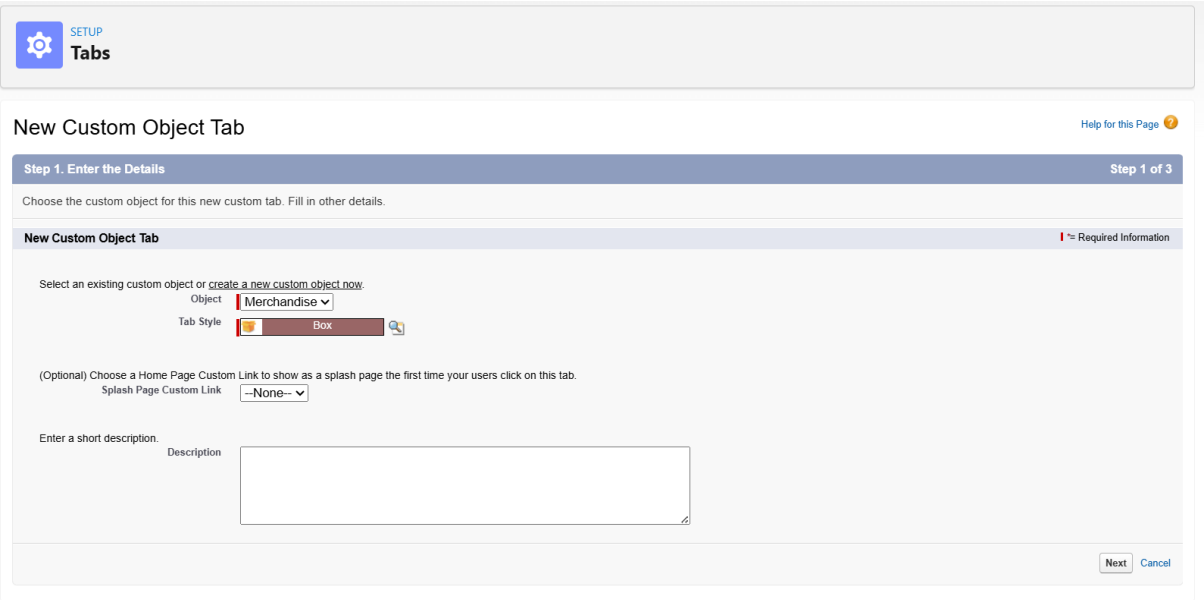
User Case Tab Style :

I utilized the "Chip" icon style for the User Case tab, identifying it as the primary workspace for support activities.



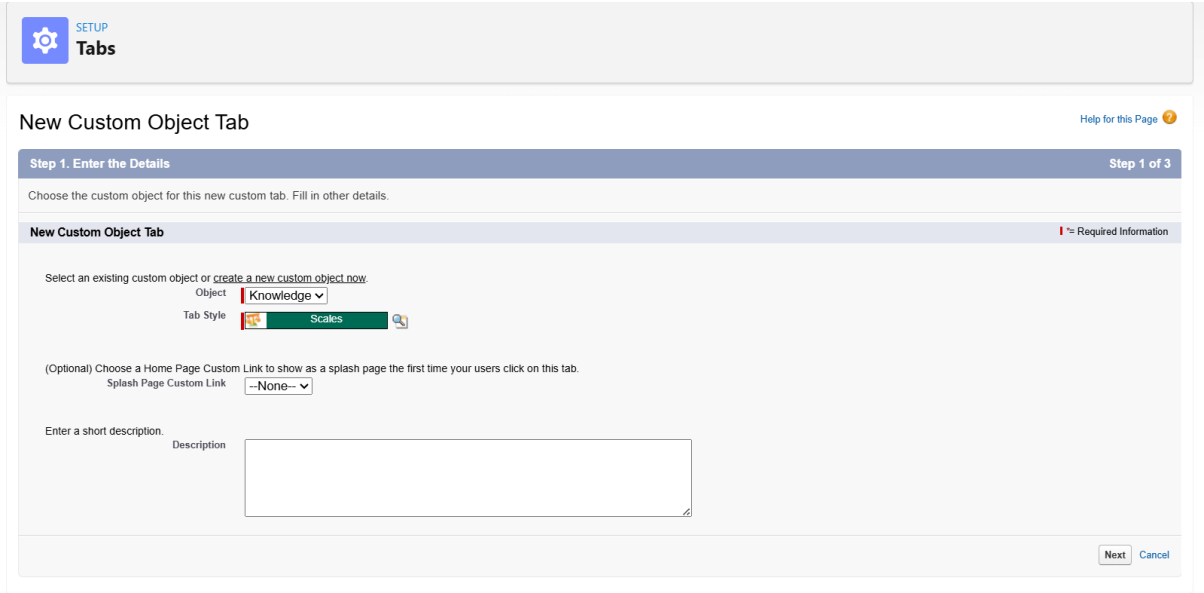
Merchandise Tab Style :

The "Box" icon was selected for the Merchandise object to visually represent inventory and product tracking.



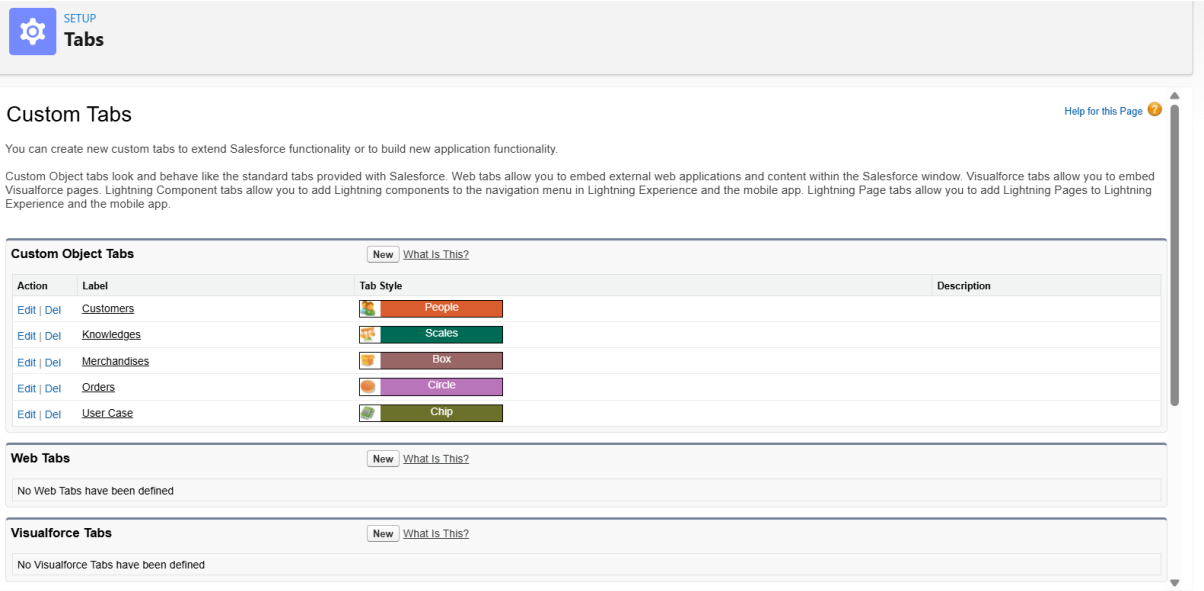
Knowledge Tab Style :

I assigned the "Scales" icon style to the Knowledge object, signaling its role as a reference and auditing tool.



Finalized Custom Tab List :

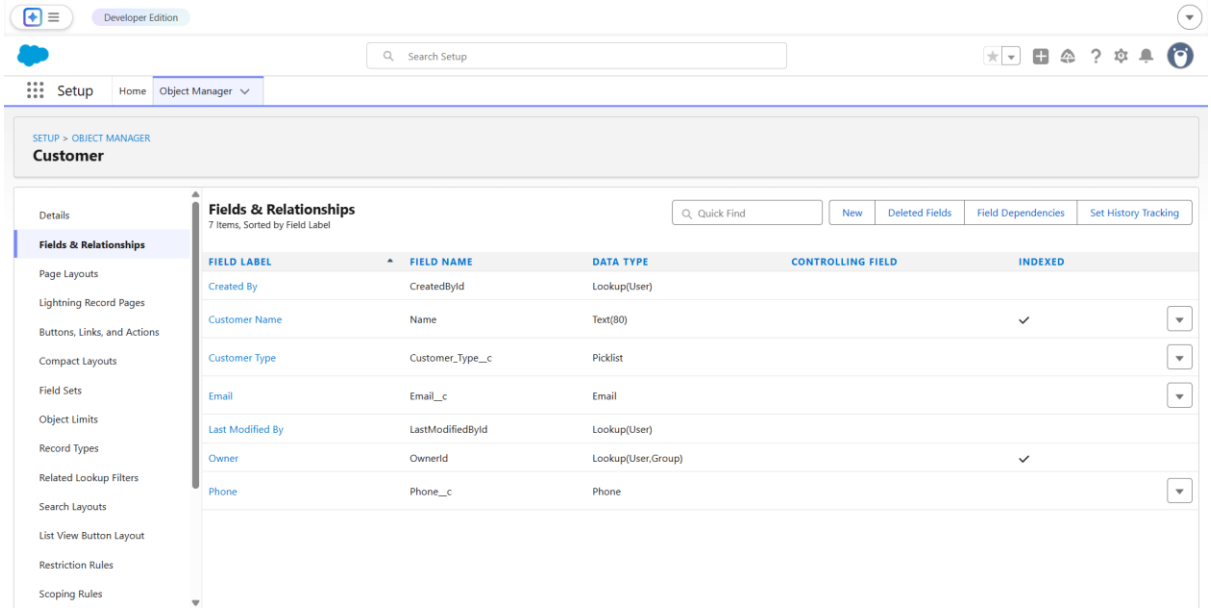
This screenshot provides a consolidated view of all five custom tabs. It confirms that the backend navigation is fully configured for the support application.



4: Data Fields and Relationships

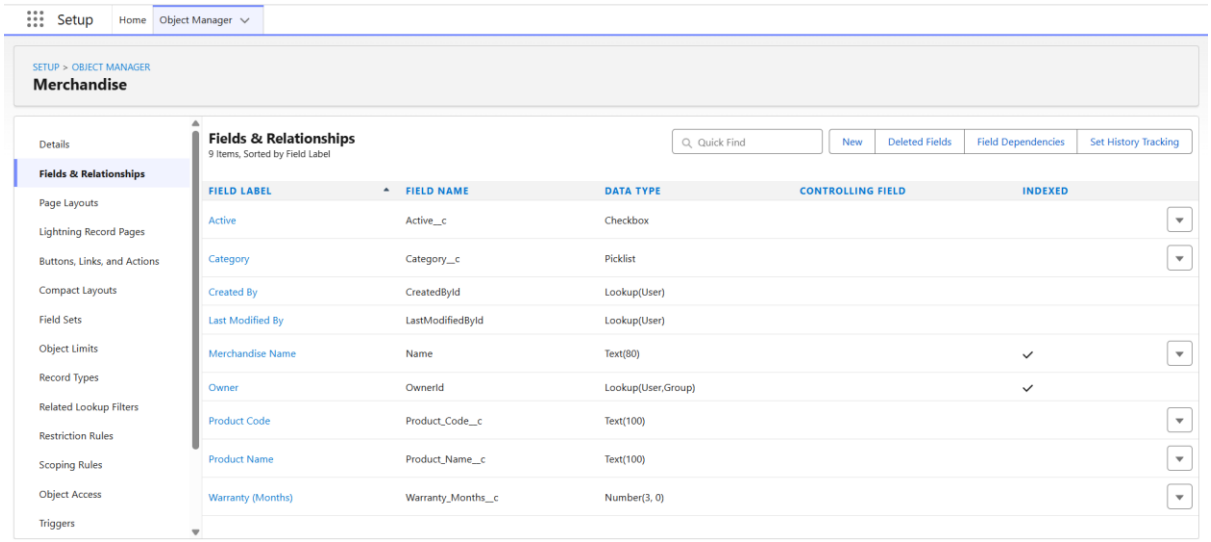
Customer Fields :

I defined the fields for the Customer object, including Customer Name, Customer Type (Picklist), Email, and Phone. This structured data ensures accurate client identification.



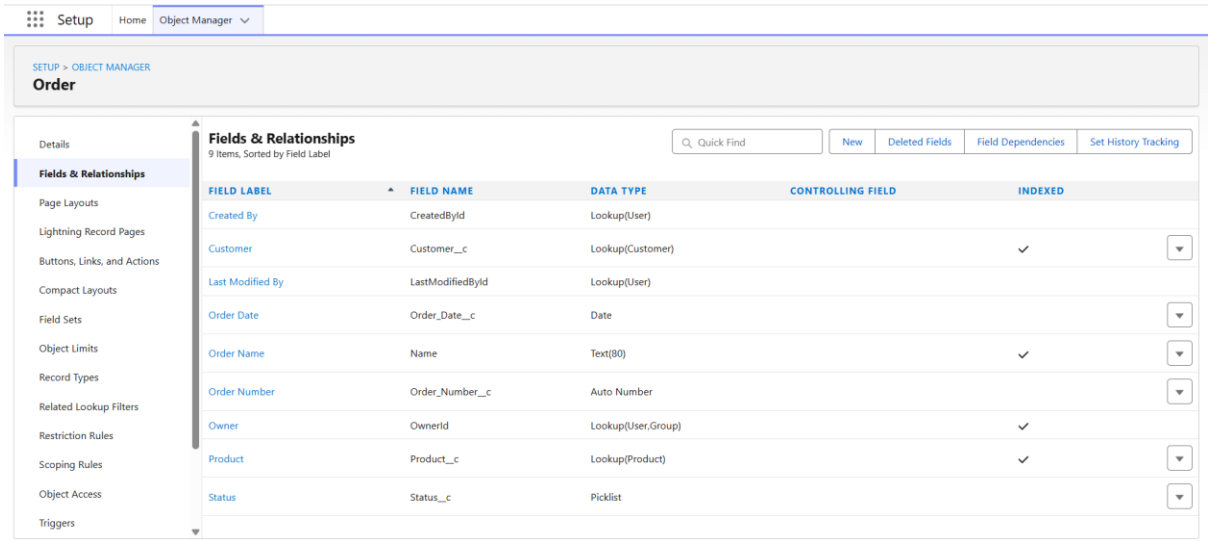
Merchandise Fields :

For this object, I implemented fields like Product Name, Product Code, and Warranty (Months). This allows for the tracking of item specifics and service eligibility.



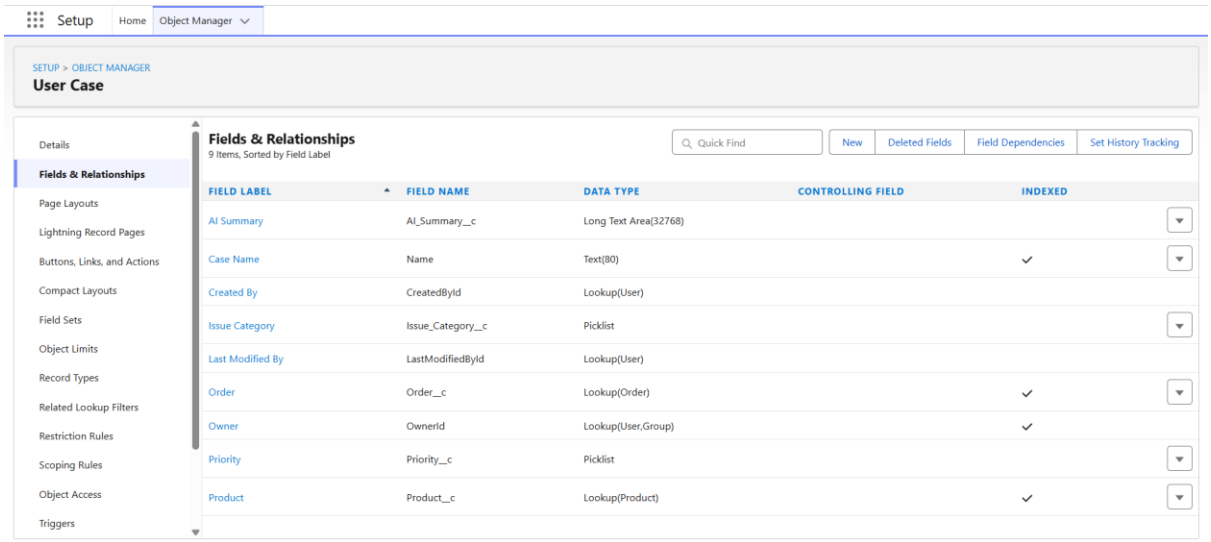
Order Fields :

This image shows the Lookup Relationships created to connect Order records to specific Customers and Products. This relational mapping is essential for automated reporting.



User Case Fields (AI Integration) :

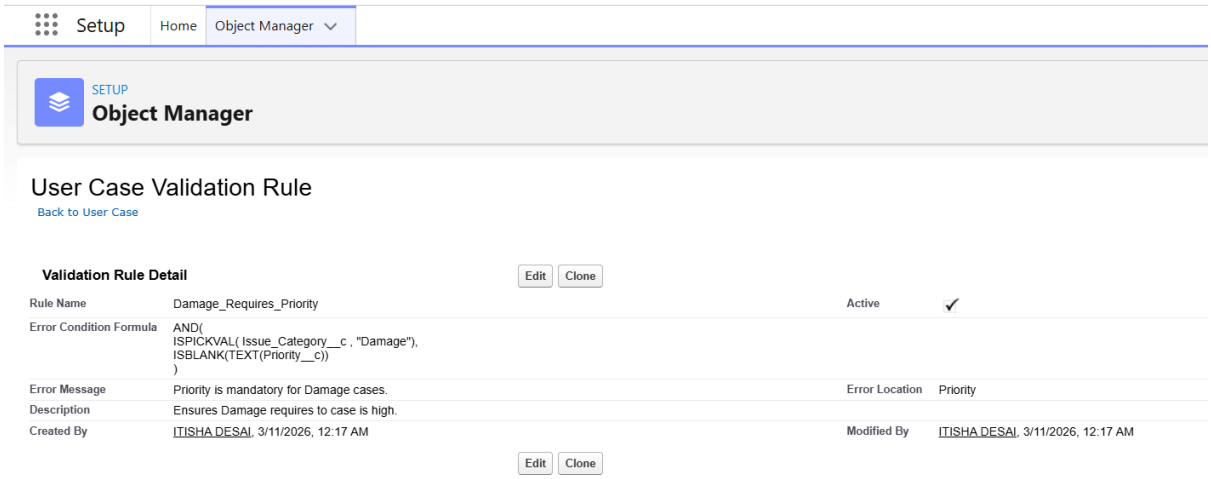
I implemented the AI Summary field as a Long Text Area. This is the designated target field for the Salesforce Prompt Builder to save automatically generated inspection summaries.



5: Data Integrity (Validation Rules)

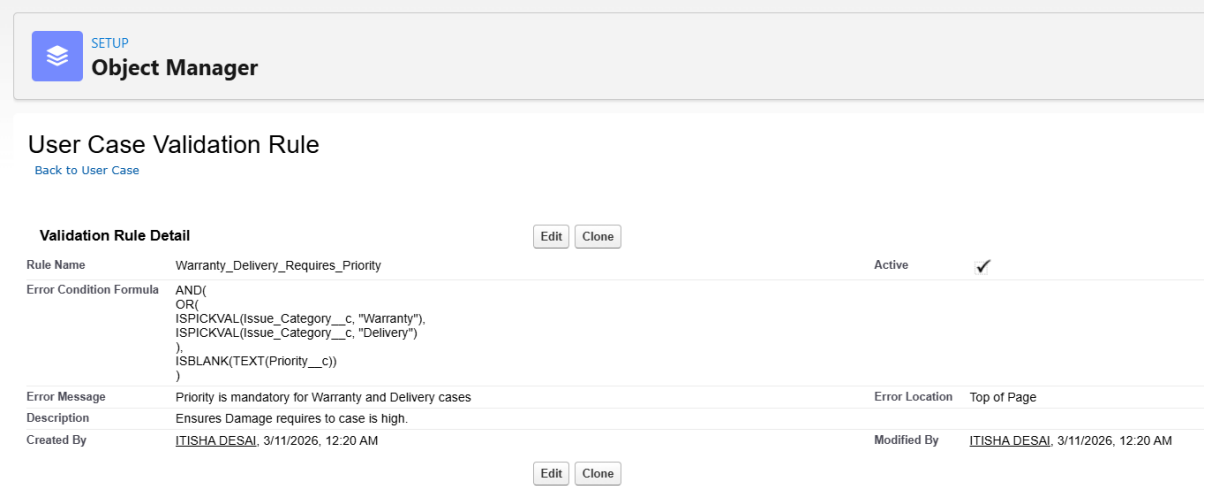
Damage Priority Validation Rule :

I created the Damage_Requires_Priority rule using a logical formula shown in screenshot.



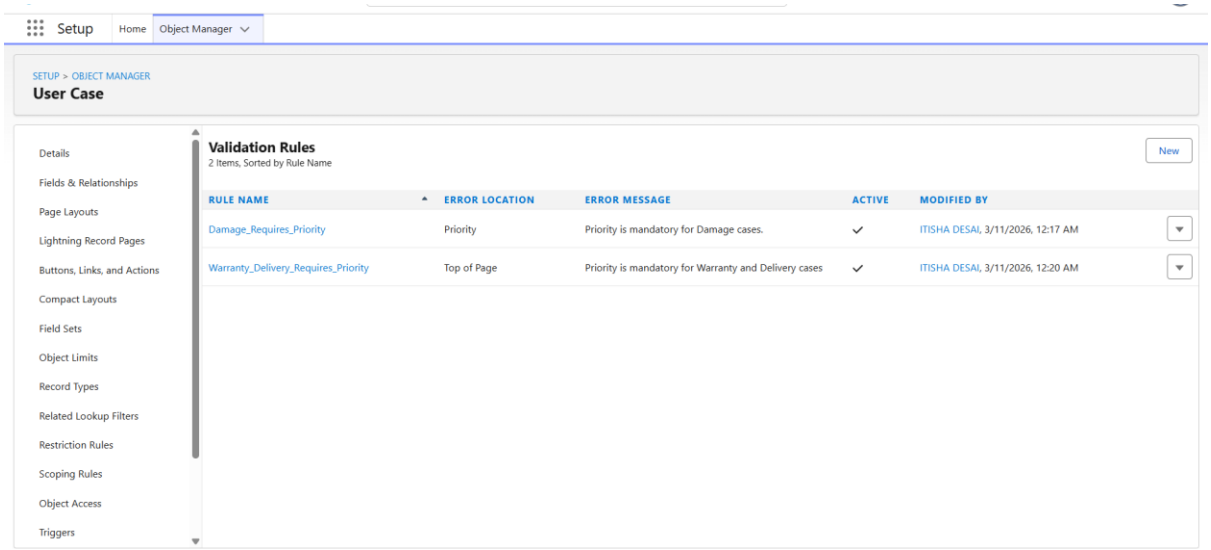
Warranty/Delivery Validation Rule :

This rule ensures that high-impact cases related to "Warranty" or "Delivery" cannot be saved without a priority level, maintaining high data standards.



Active Validation Rules Summary :

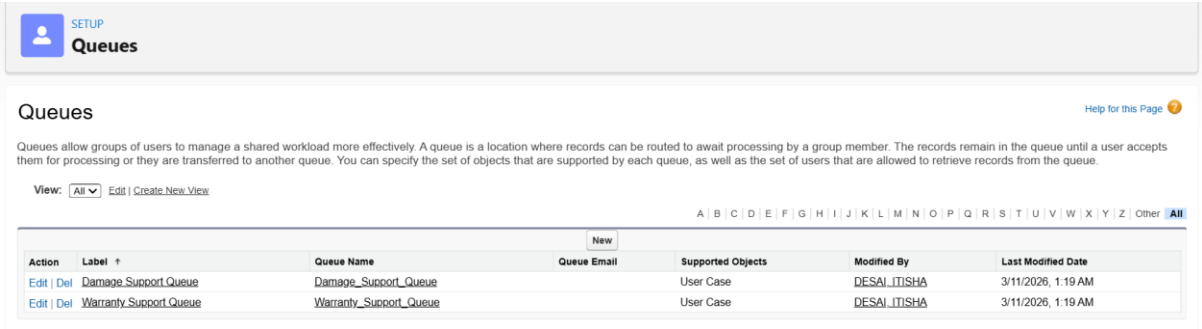
This provides an overview of all active rules on the User_Case__c object, confirming that business logic for data accuracy is enforced.



6: Support Automation (Queues and Flows)

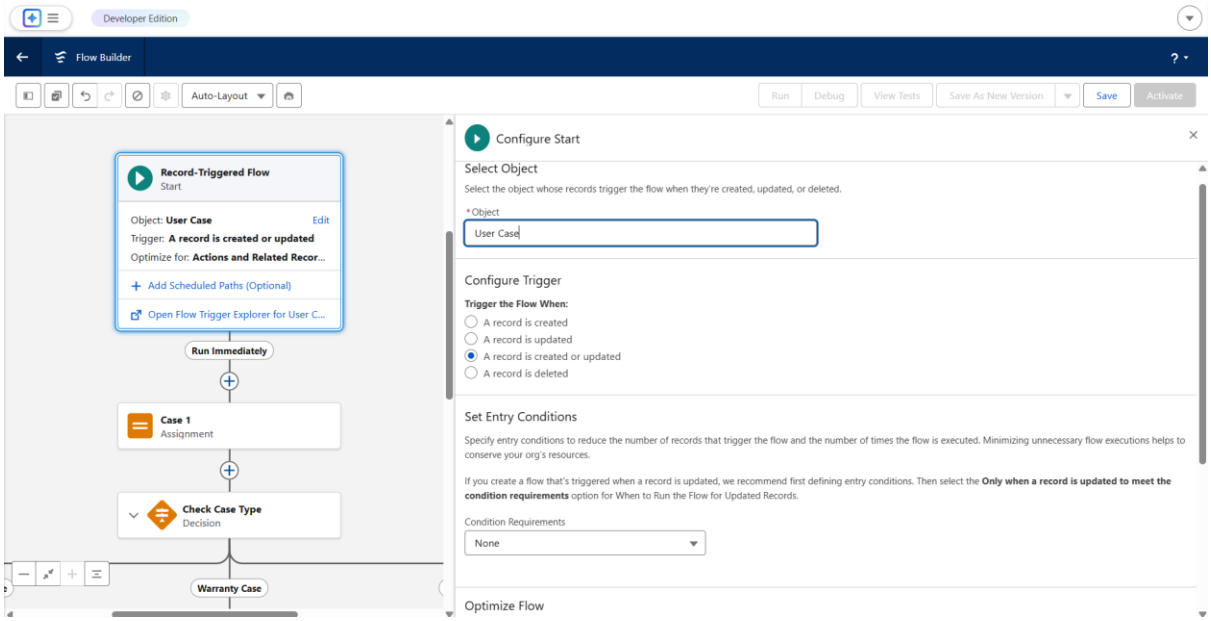
Support Queues :

I established the "Damage Support Queue" and "Warranty Support Queue". These act as containers for incoming cases, allowing them to be routed to specialized agent groups.



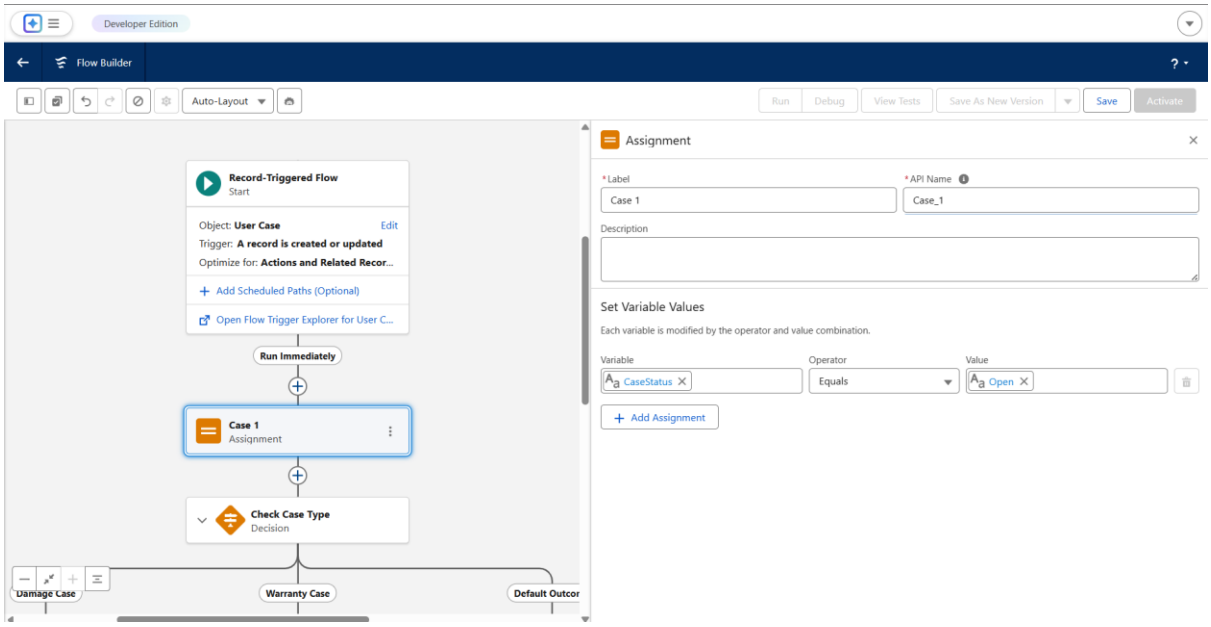
Flow Builder - Trigger :

I built a Record-Triggered Flow that initiates whenever a User_Case__c is created or updated. This is the engine for the "Service Automation" part of the project.



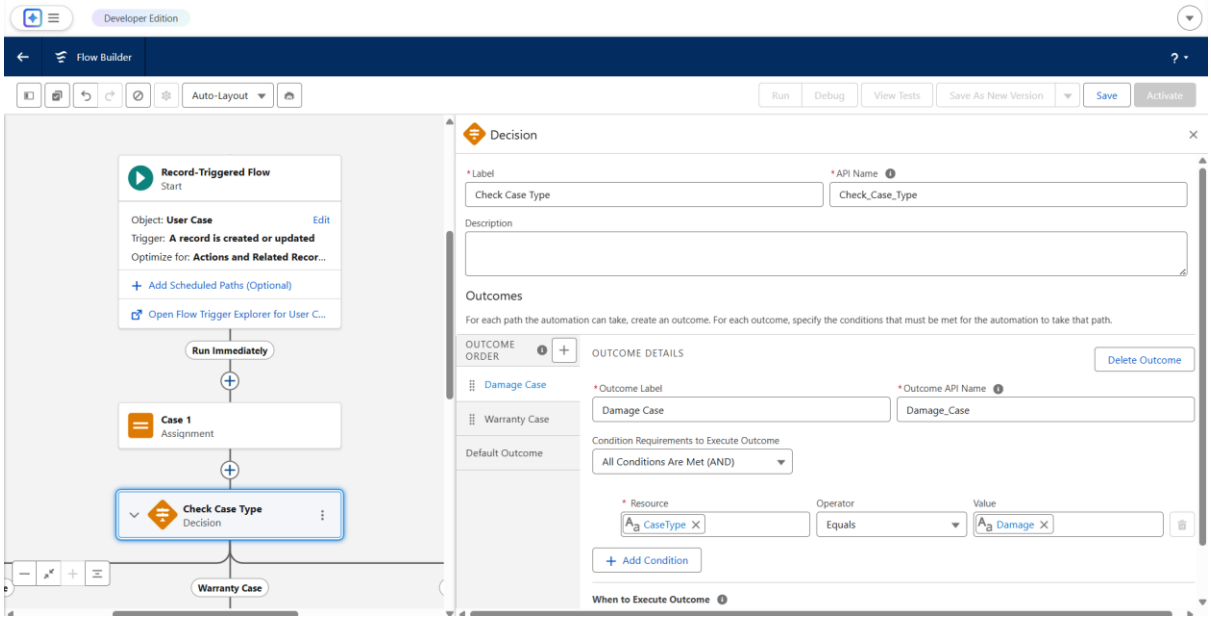
Flow Assignment Element :

In this step, the flow uses an Assignment element to set the initial variables, such as setting the Case Status to "Open" immediately upon creation.



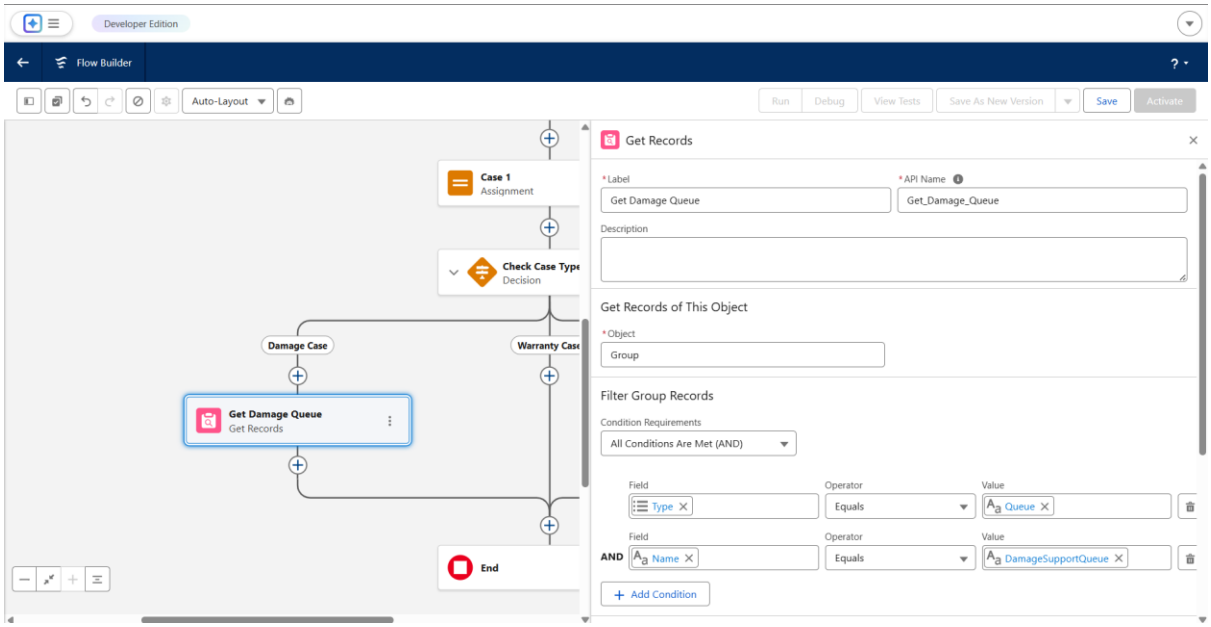
Flow Decision Logic :

This screenshot shows the "Check Case Type" decision node. It evaluates the issue category to determine whether the case should be routed to the Damage or Warranty path.



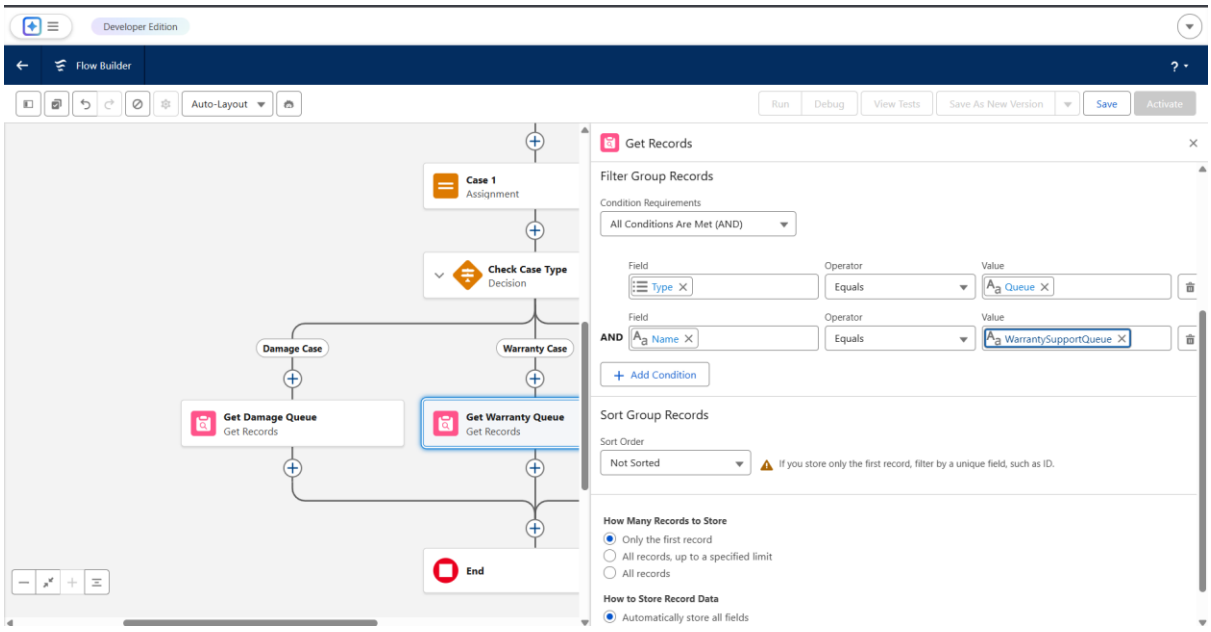
Flow Get Records (Queue Identification) :

The flow uses a Get Records element to find the specific ID of the "Damage Support Queue" from the system, ensuring the case is routed to the correct group.



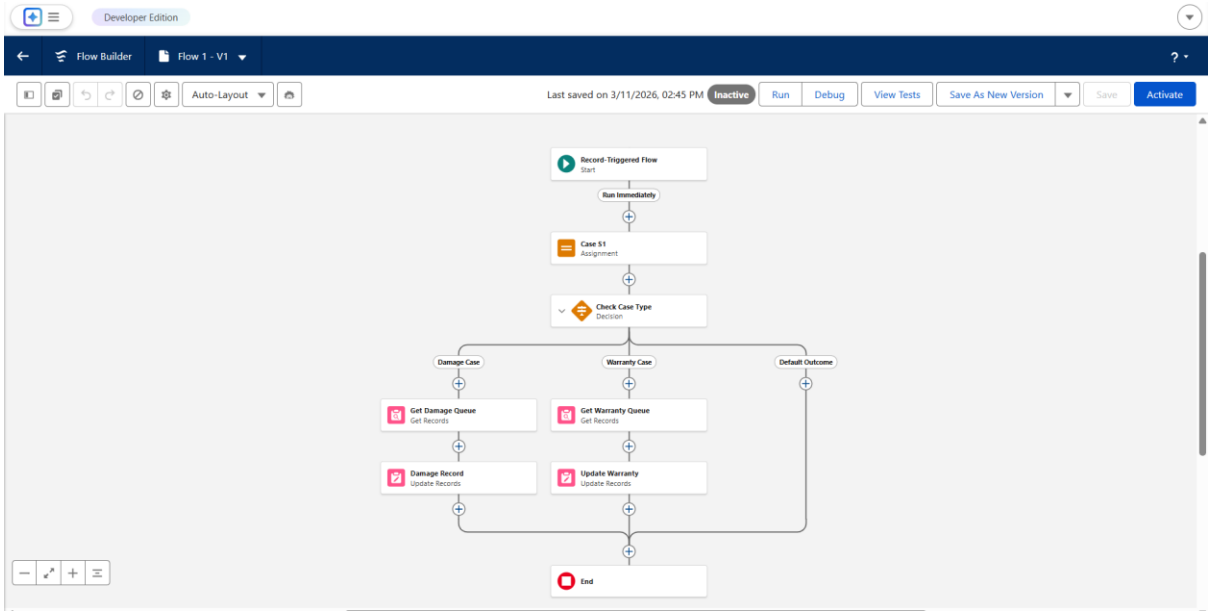
Flow Get Records (Warranty Path) :

A similar logic is applied to the "Warranty Case" path, where the flow retrieves the correct queue ID for warranty-related issues.



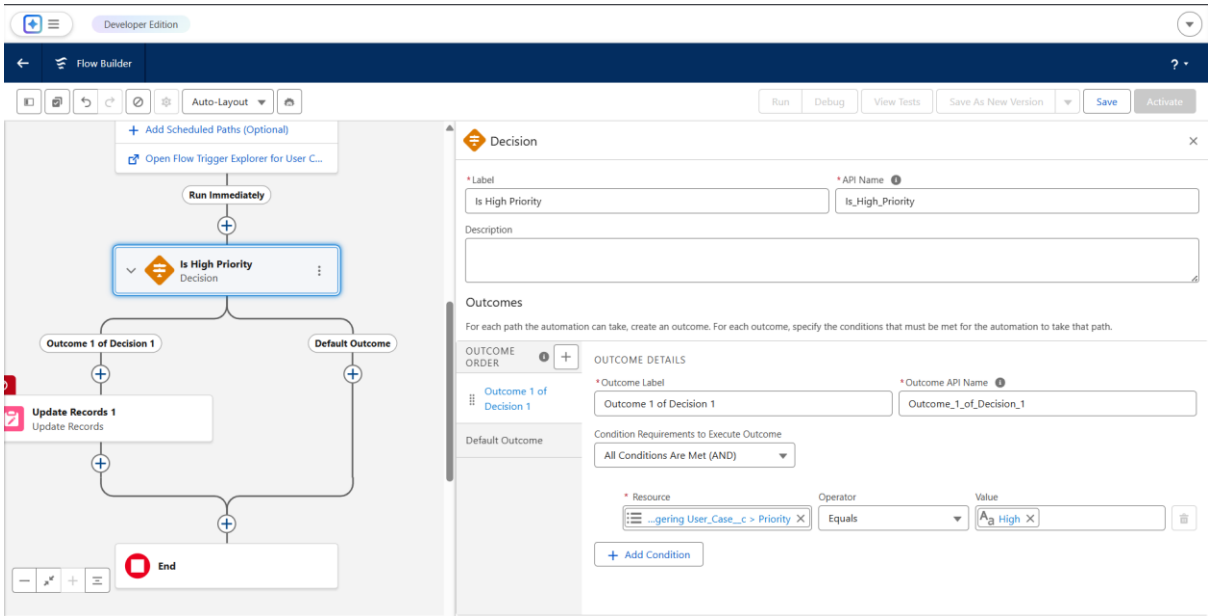
Full Automation Architecture :

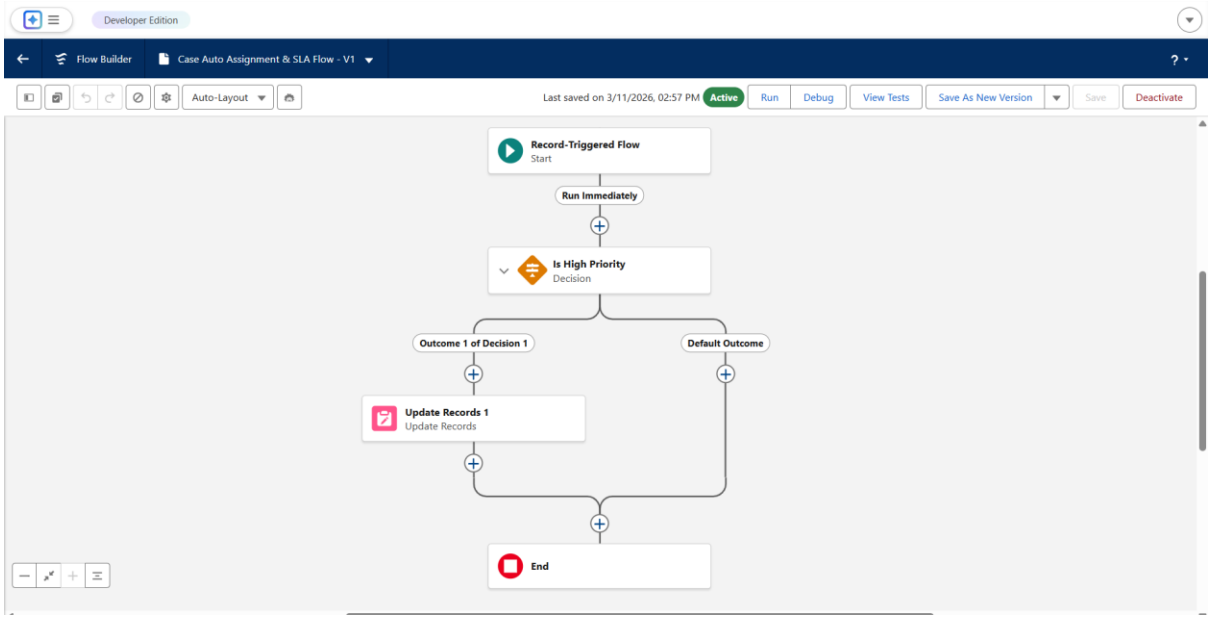
This image displays the completed flow diagram. It showcases the end-to-end automation from record creation through classification and finally to queue assignment.



SLA Decision Element :

I added an "Is High Priority" check to the flow. This ensures that critical customer issues follow an accelerated path to meet organizational service levels.



Automated Record Update :


The final step in the flow executes the update on the record, committing all AI-driven assignments and status changes to the database.
